Computer Science Co-op Student @ uOttawa — Software, AI & Quantitative Development

EDUCATION

University of Ottawa

Ottawa, ON

B.Sc. (Specialized) in Computer Science, Co-op

September 2024 – April 2028

- International Student Merit Scholarship (\$36,000/yr)
- Relevant coursework: Data Structures and Algorithms, Object-Oriented Programming, Computer Architecture

EXPERIENCE

Data Annotation & AI Training Specialist

June 2025 – October 2025

DataAnnotation

Remote, ON

- Evaluated LLM outputs and generated code for logical reasoning, prompt adherence, factual accuracy, and algorithmic efficiency
- Wrote a local Python script that ran edge-case checks (empty lists, unwanted negative values) on code I was reviewing
- Identified systematic model errors and boundary-condition bugs, writing clear technical evaluations to guide model adjustments

PROJECTS

Seren | *React, TypeScript, FastAPI, PostgreSQL, JWT, Claude API*

April 2026 – Present

- Built a full-stack platform with a FastAPI REST API, PostgreSQL through SQLAlchemy, JWT authentication, and a React/TypeScript dashboard that imports .ics calendars
- Wrote a Chrome extension (Manifest V3) using the Claude API to explain, summarize, and quiz on selected text
- Shared one JWT session between the extension and the web app, so one login covers both

Trading Model Explainability Platform | *Python, SHAP, hmmlearn, FastAPI, pytest*

August 2026 – Present

- Building a tool that explains a trading model's predictions with SHAP, a backtest engine, and regime detection from a Hidden Markov Model that only sees past data
- Runs user-submitted models in a Docker sandbox with no network and limits on memory and run time
- Wrote a pytest suite in five modules (API routes, backtest engine, signal validation, regime detection, SHAP), with an additivity test and a synthetic RSI-only model test

AITradingAgent | *Python, Redis, PostgreSQL/TimescaleDB, Docker, Git*

June 2026 – Present

- Split the backend into Python services (technical analysis, risk, decision engine) linked by Redis pub/sub
- Stored data in PostgreSQL/TimescaleDB with Pydantic schemas at every service boundary and a rule-based check that blocks orders breaking risk limits
- Backtested strategies on futures data and dropped three that underperformed, with a diagnostic report for each

MARA | *Python, Claude API, Whisper, CUDA, PyQt5*

April 2026 – June 2026

- Built a local voice assistant where the LLM chooses to reply, run a system action, or call a tool
- Ran audio, vision, and automation on separate threads; stored memory in an encrypted local file

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, SQL, HTML/CSS

Frameworks & APIs: React, FastAPI, Node.js, REST APIs, JSON, Microservices

Databases & Data: PostgreSQL, Redis, TimescaleDB, Pandas, NumPy, SHAP, hmmlearn, Pandera

Testing & Practices: Unit and Integration Testing (pytest), Object-Oriented Programming, Debugging, Agile

AI: LLM APIs (Claude API), Tool-Calling Agents, AI-Assisted Development (GitHub Copilot)

Tools & Cloud: Git, Gradle, Docker, Continuous Integration/Continuous Deployment (CI/CD), AWS (EC2), Linux

Other: Bilingual (English/French)
